

QA Onboarding Guide

Sample company document generated for testing QABuddy. QA team, April 2026.

1. Your first week

1. Get access to Jira (project VWO and the QAB sample project), Jenkins and the Allure reports.
2. Clone both frameworks: ATB13xSeleniumAdvanceFramework (Java, TestNG) and AdvancePlaywrightFramework1x (TypeScript).
3. Run one Selenium suite and one Playwright suite locally (section 3).
4. Read the QA Process Handbook and the Automation Coding Standards.
5. Pair with an SDET on one failing CI build and write the triage notes together.

2. Tools and access

Tool	What it is for	Who grants access
Jira	Bugs, test design tasks, flaky test tracking	Pramod
Jenkins	vwo-selenium-regression and playwright-e2e jobs	Rahul Verma
Allure	Selenium test reports with screenshots	Rahul Verma
QABuddy	Ask questions across code, tests, bugs, docs and CI logs	Automatic for the QA team

3. Running the tests locally

3.1 Selenium

Install Java 17 and Maven. From the repository root run `mvn test -Dsurefire.suiteXmlFiles=testng_vwo_prop_improved_pom_part3.xml`. Configuration such as the VWO URL and test accounts comes from `src/main/resources/data.properties`.

3.2 Playwright

Install Node 20, run `npm ci` and `npx playwright install chromium`, then `npx playwright test`. Set `TTA_ENV` to `qa`, `stage` or `prod` to switch the base URL. Locally there are no retries; on CI there are two.

4. How we work

Every bug links a test case ID and, for CI failures, a Jenkins build number. Before filing a bug, search Jira and ask QABuddy for duplicates. A login failure with valid credentials is treated as S1 until it is proven to be environment-specific.

When a test fails on CI but passes locally, check the environment first: IP allowlists, expired test accounts and shared users in parallel runs caused most of the CI failures this quarter.

5. Who to ask

- Pramod, QA Lead: process, priorities, release sign-off.
- Ananya Rao, SDET: Selenium and Playwright framework questions.
- Rahul Verma, DevOps: Jenkins, agents, IP allowlists.
- Meera Iyer, Product Manager: requirements and the PRD.

6. Glossary

- POM: Page Object Model, one class per page with locators and actions.
- RTM: Requirements Traceability Matrix.
- Flaky test: fails and then passes on retry in the same build.
- SmartStats: VWO's Bayesian statistics engine for A/B test results.
